//notes"Organ: heart; Vector: Lambda ZAP II, pKSII-;

Site_1: NotI; Site_2: NotI; Human heart cDNA library was
constructed in Lambda ZAP II vectors using NotI linkers.

Clones from the primary cDNA library were deposited into
96-well trays for storage and retrieval. The 'Isolation of
chromosome-specific genes by reciprocal probing of arraed
cDNA and cosmid libraries' (Human Molecular Genetics, 1995

Vol. 4, No 8; pp1373-1380) provided cDNA-Clones as
plasmids (vector pKSII-, E. coli)."

English

The patent discloses novel target genes abnormally expressed in heart tissues and their corresponding proteins. The invention also relates to comethods for assessing the expression level of these genes. The method comethods for assessing the predisposition of mammals and preferably humans comeful to treat disease or for an acute state of such a disease. It is also considered that the cardiomyopathy, and the heart such as congestive heart failure, conjustive cardiomyopathy, hypertrophic cardiomyopathy, ischaemic cardiomyopathy, specific heart muscle disease, rhythm and conduction disorders, componently, specific heart muscle disease, rhythm and conduction disorders, component for mention pulmonary heart disease, systemic arterial competension, pulmonary heart disease, valvular conducations, congenital heart disease, pericardial disease and conductions. Sequences of the invention are also used in gene therapy. Care useful for the development for medicaments for the treatments of cheart diseases. The present sequence is a cDNA from 66214 clone. This sequence used in the exemplification of the invention.

tissues and their corresponding proteins. The invention also relates to comethods for assessing the expression level of these genes. The method comethods for assessing the expression level of these genes. The method comethods for testing the predisposition of mammals and preferably humans cometing the treat disease or for an acute state of such a disease. It is also constitute cardiomyopathy, hypertrophic cardiomyopathy, ischaemic cardiomyopathy, precific heart muscle disease, rhythm and conduction disorders, comporathy, perferably heart disease, systemic arterial comporathy, pulmonary heart disease, systemic arterial comporation, pulmonary hypertension, pulmonary heart disease, valvular conductations. Sequences of the invention are also used in gene therapy. Comporated for the development for medicaments for the treatments of the invention composition the sequences of the invention composition in the sequence is expressed sequence tag composition.

The present sequence is the cDNA encoding the human chisel gene (Cs1) that is mapped to the human chromosome Xq21.3-q22. It comprises 5 exons. It is a member of the EF-Hand protein super family and is involved in signalling pathways. It is predominantly expressed in heart and skeletal functions in regulation aspects of differentiation of cells. Cs1 functions in regulation aspects of differentiation or adaptive processes that maintain muscle homeostasis. This sequence can be used in the detection, diagnosis, prophylactic and therapeutic treatment of diseases such as those involving aberrant muscle cell development and functional activity. It is also used in the treatment of muscular and myotonic dystrophies, skeletal myopathies such as Duchenne muscular dystrophy, heart failure, cardiac hypertrophy,

The invention relates to a method of diagnosing (I) the onset or progression of benign prostatic hyperplasia (BPH), or screening (II) fo or identifying an agent that modulates the onset or progression of BPH. The method is based on changes in gene expression in BPH tissue isolate from patients exhibiting different clinical states of prostate hyperplasia as compared to normal prostate tissue. (I) comprises from the subject that are differentially regulated compared to normal prostate cells. (II) comprises preparing a first gene expression profile of BPH cells or BPH-like cell population, exposing the cells to the agent, preparing a second gene expression profiles.

(I) is useful for diagnosing the onset or progression of BPH. (II) is
                                                                                                                                                                                                                                                                                                                                                                                       Identifying drugs for and diagnosing benign prostatic hyperplasia, by detecting expression levels of one or more genes in prostate cells from parient that are differentially regulated compared to normal prostate
                                                                                                                                                                                                                                                                                                                                        Disclosure;

The methods are useful to present information identifying the expression level in a tissue or cells, by comparing the expression level of genes given in the specification in the tissue or cells to the level of expression of gene in the database, and displaying the expression levels of at least one gene in the tissue or cell sample compared to the expression level in BPH. Agents using (II) are useful treating BPH or prostate cancer. ABK64106-ABK64860 represent human benign prostatic hyperplasia gene sequences of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a method (M1) for screening for an CC anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in CC expression of at least one gene (I) of a signature gene set, where (I) CC comprises a sequence (S) selected from 8447 sequences (Siven in ABI-70110), or is at least 95% identical to (S), where a change in CC to ABI-70110), or is at least 95% identical to (S), where a change in CC activity and can be used in gene therapy. M1 can be used for screening CC an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a CC result of M1, and the data is sufficient to convey the chemical CC expression, ovarian, kidney, prostate or pancreatic cancer, cancer, cancer, squamous cell cancer, infiltrating ductal cancer, cinfiltrating doutal cancer, squamous cell carcinoma, neuroendocrine CC carcinoma, papillary carcinoma and Wilm's tumour.

                                                                                                                                        The present sequence is the cDNA encoding the murine chisel gene (Cs1) CC that is mapped to the mouse X chromosome. It is a member of the EF-Hand protein super family and is involved in signalling pathways. It is correctly expressed in heart and skeletal muscles and is activated CC after the differentiation of cells. Csl functions in regulation aspects of differentiation or adaptive processes that maintain muscle corphylactic and therapeutic treatment of diseases such as those CC prophylactic and therapeutic treatment of diseases such as those CC is also used in the treatment of muscular and functional activity. It is also used in the treatment of muscular and myotonic dystrophies, cC myotonic dystrophy, heart failure, cardiac hypertrophy, myocarditis, CC myotonic dystrophy, heart failure, cardiac hypertrophy, myocarditis, cc myofiber atrophy, etc. The Csl gene sequence can also be used in gene therapy, for the production of transgenic animals and for drug screening.

An ORF has been identified within the sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed CDNA libraries. Such ESTs are not well suited for isolating CDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene thorapy and chromosome mapping procedures. They are used to obtain vaccines

The present invention describes oligonucleotide libraries for detecting CC messenger RNAs that populate a (sub-)transcriptome, where the CC (sub-)transcriptome comprises messenger RNAs transcribted from multiple CC (sub-)transcriptome units that populate a genome. The library comprises CC several oligonucleotides, each capable of hybridising selectively to a SC (set of messenger RNAs transcribed from a given transcription unit of CC the genome, which encodes one or more messenger RNAs splice variants. CC The oligonucleotide libraries are useful for detecting mRNAs from a CC biological sample, in expression profiling studies, in qualitatively or CC quantitatively characterising the corresponding transcriptome, and in CC transcriptomes. The libraries may also be used as specialised mini CC transcriptomes. The libraries may also be used as specialised mini CC particular biological or pathology specific genes such as those genes CC only expressed in specific tissue under a specific pathological CC condition; to detect developmental specific genes such as those genes CC transcripts and splice variants of a transcriptome of a patient suffering CC condition; to detect developmental specific genes; and to detect RNA CC transcripts and splice variants of a transcriptome of a patient suffering CC oligonucleotide sequences from ratt, humans and mice, which are used in CC the exemplification of the present invention

                                                                                                                                                           cc acids comprising at least 18 base pairs of the chemically pretreated DNA co f genes associated with DNA repair selected from PMS2L1, PMS2L12, PMS2L13, PMS2L13, PMS2L5, PMS2L5, PMS2L5, PMS2L5, PMS2L5, PMS2L6, MGMT, MSB2, NUDT1, TDG, INPPL1, CC PMS2L23, PMS2L5, PMS2L5, PMS2L6, MGMT, MSB2, NUDT1, TDG, INPPL1, CC PMS2L13, PMS2L6, Nucleic acids of the invention and related coligomers, are useful for diagnosis of diseases associated with gene corpair, specifically ataxia telangiectasia, aging, Bloom's syndrome, CC Cockayne syndrome, Nijmegen breakage syndrome or Werner syndrome, CC cockayne syndrome, trichthiodystrophy, Fanconi's anaemia, solid tumours candidated the particularly by determining status of cytosine methylation of candor by deterting single-nucleotide polymorphisms. Determination of CC and/or by detecting single-nucleotide polymorphisms. Determination of cherapies. The sequences given in records ABL92132-Ral92335 represent CC therapairs. The sequences given in records ABL92132-Ral92335 represent CC repair, and their complements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to nucleic acids containing a sequence of at least 18 nucleotides of chemically treated DNA of genes associated with DNA repair, and their complements. The invention also relates to nucleic acids comprising at least 18 base pairs of the chemically pretreated DNA of genes associated with DNA repair selected from PMS2L1, PMS2L12,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              06-APR-2000; 2000DE-1019058.

CC The invention relates to nucleic acid sequences comprising at least 18 CC bases of a chemically pretreated gene associated with gene regulation, CS selected from 94 genes (ABL49301-ABL49394) and/or complementary sequences CC associated with DNA replication, CENUB, DNA21, ATR, CHDIL, ERCG3, SNRPA1, CC unmethylated at the 5-position to uracil or another base with DNA replication and the converts cytosine bases (CC hybridisation behaviour dissimilar to cytosine, to enable analysis of CC cytosine methylations. The DNA sequences and method are useful in the CC cytosine methylations of such diseases and method are useful in the CC replication and in therapy of such diseases, by enabling analysis of the cytosine methylation patterns of such genes. They are especially useful of diagnosis and therapy of e.g. Ataxia telangiectasia, ATR-X, Bloom's Note: The sequence data for this patent did not form part of the printed specification and was supposed to be available directly from WIPO at the correspond to that referred to in the specification. The present data of taken from EPO data for the patent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT 10

The present invention provides a number of the final sequences which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer, s disease, AIDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
